**ABSTRACT**

*Centella asiatica* is a valuable medicinal herbaceous aromatic creeper which has been valued for centuries in ayurvedic medicine. Phytochemical analysis of *Centella asiatica* plant extracts revealed the presence of various biochemical compounds such as alkaloids, flavonoids, glycosides, triterpenoids and saponins etc. Our present work aims at evaluating the in-vitro anti-thritic effect of *Centella asiatica* at various concentrations. The inhibition of protein denaturation and membrane stabilisation were taken as a measure of the in vitro anti-arthritic activity. The maximum percentage inhibiton of protein denaturation and membrane stabilisation for *C. asiatica* extracts ware found to be 89.76 % and 94.97 % respectively at a dose of 2000 µg/ml. Therefore, our studies support the isolation and the use of active constituents from *Centella asiatica* in treating arthritis.

**Key words:** Anti-arthritic activity, *Centella asiatica*, Diclofenac sodium, Triterpenoids, Flavonoids, Protein denaturation.

**INTRODUCTION**

Rheumatoid arthritis is a major ailment among rheumatic disorders. It is a chronic condition with multiple causation and affects the people in their most active period of life. The production of auto antigens in certain arthritic diseases may be due to in vivo denaturation of proteins\(^1\) and The mechanism of denaturation probably involves alteration in electrostatic, hydrogen, hydrophobic and disulphide bonding\(^3\). So, by controlling the production of auto antigen and inhibiting denaturation of protein and membrane lysis in rheumatic disease leads to anti-arthritic activity. Hence, inhibition of protein denaturation and membrane lysis were taken as a measure of the in vitro anti-arthritic activity. A larger number of herbal extracts are in vogue for the treatment of various types of arthritis.
MATERIAL AND METHODS

Collection of Plant Material
The fresh whole plant of *C. asiatica* was collected from in and around the premises of Andhra University, City of Visakhapatnam, Andhra Pradesh, India. All the other chemicals and reagents were of pure analytical grade and obtained from local supplier.

Extraction and Preparation of Extract
The leaves were garbled and dried under shade and powdered. The 10 g of dried powdered leaves of the plant materials were extracted separately with methanol using soxhlet apparatus for 48 hrs. The solvent was distilled at lower temperature under reduced pressure and concentrated on water bath to get the crude extract which is stored in desiccator for future use. The % of yield is 13.37 % respectively.

Inhibition of Protein Denaturation
1. Test solution (0.5ml) consist of 0.45ml of Bovine serum albumin (5%W/V aqueous solution) and 0.05ml of test solution.
2. Test control solution (0.5ml) consists of 0.45ml of bovine serum albumin (5%W/V aqueous solution) and 0.05ml of distilled water.
3. Product control (0.5ml) consists of 0.45ml of distilled water and 0.05 ml of test solution.
4. Standard solution (0.5ml) consists of 0.45ml of Bovine serum albumin (5%w/v aqueous solution) and 0.05ml of Diclofenac sodium.

Various concentrations (50, 100, 250, 500, 1000, 2000 µg/ml) of plant extracts (test solution) and diclofenac sodium (standard) of were taken respectively. All the above solutions were adjusted to pH 6.3 using 1N HCl. The samples were incubated at 37°C for 20 minutes and the temperature was increased to keep the samples at 57°C for 3 minutes. After cooling, add 2.5 ml of phosphate buffer to the above solutions. The absorbance was measured using UV-Visible spectrophotometer at 416nm.

The control represents 100% protein denaturation. The results were compared with Diclofenac sodium. The percentage inhibition of protein denaturation of different concentrations was tabulated in Table.1 & Fig. 1.

The percentage inhibition of protein denaturation can be calculated as,

\[
\text{Percentage inhibition} = \left[100 - \frac{\text{optical denity of test solution} - \text{optical density of product control}}{\text{optical density of test control}}\right] \times 100.
\]

Effect on membrane stabilisation / Inhibition of membrane lysis
The principle involved here is stabilization of human red blood cell (HRBC) membrane by hypotonicity induced membrane lysis. The assay mixture contains 1ml phosphate buffer [pH 7.4, 0.15 M], 2 ml hypo saline [0.36 %], 0.5 ml HRBC suspension [10 % v/v] with 0.5 ml of plant extracts and standard drug diclofenac sodium of various concentrations (50, 100, 250, 500, 1000, 2000 µg/ml) and control (distilled water instead of hypo saline to produce 100 % hemolysis) were incubated at 37°C for 30 min and centrifuged respectively. The hemoglobin content in the suspension was estimated using spectrophotometer at 560 nm. The percentage of membrane stabilisation at different concentrations was tabulated in Table.1 & Fig. 2

The percentage inhibition of membrane stabilisation can be calculated as,

\[
\text{Percentage inhibition} = 100 - \left[\frac{\text{optical denity of test solution}}{\text{optical density of control}}\right] \times 100\%
\]

RESULTS AND DISCUSSION
The methanolic extracts of *Centella asiatica* has showed significant activity at various concentrations and its effect was compared with the standard drug Diclofenac sodium. The maximum percentage inhibition of protein denaturation and membrane stabilisation was observed as 89.76% and 94.97 % at 2000 µg/ml respectively as shown in Table. 1. The production of auto antigen in certain arthritic disease may be due to denaturation of protein and membrane lysis. From the results (Fig. 1 & 2) of our present study, it can be stated that methanol extracts are capable of controlling the production of auto antigen and inhibits denaturation of protein and membrane lysis in rheumatic disease.

CONCLUSION

Inhibition of protein denaturation and membrane stabilisation was studied to establish the mechanism of anti-arthritic effect of C. asiatica. Therefore, our present in-vitro studies on C. asiatica extracts demonstrate the significant anti-arthritic activity. Due to the presence of active principles such as flavonoids and triterpenoids (asiaticoside, madecassoside etc) and related polyphenols may responsible for this activity. Hence, C. asiatica can be used as a potent anti-arthritic agent.
