(Received: 10 June 2014; accepted: 02 August 2014)

Formulation is a major step in the successful commercialization of microbial inoculants used as biofertilizers and biocontrol agents. Although formulation research is progressing slowly, several developments including liquid and granular formulations have contributed to the ease of use at the farm combined with the economic benefits of increased crop yield levels. In the present study, the bacterial biofertilizers; *Rhizobium*, *Azotobacter* and *Azospirillum* were formulated with Biogel matrix and the formulated biofertilizers were evaluated for seedling emergence of respective biofertilizers treated with Green gram (*Vigna radiata*) and Black gram (*Vigna mungo* L.). The persistence and soil enzyme activity such as Alkaline phosphatase, Urease, total N, P and K content and Nitrate reductase assay was also studied. Biogel matrix formulation of all the tested biofertilizers showed improved persistence and plant growth parameters. The study suggests the possible utilization of formulation of biofertilizers with Biogel matrix.

**Key words:** Biofertilizers, Formulation, Encapsulation, Persistence, Biogel matrix.

Biofertilizers are microorganisms that help plants to grow by increasing the quantity of nutrients. Since these fertilizers contain living microorganisms, it increases or promotes the supply of important nutrients crucial for the overall productivity of the soil. An increasing number of farmers and agriculturists are turning to the use of biofertilizers as these are gentler on the soil as against chemical fertilizers<sup>1,2</sup>. It is easier to fully appreciate the importance of biofertilizers when we know how harmful chemical fertilizers can get for the soil and the crop. Chemical fertilizers are meant to boost the growth of plants and increase the fertility of the soil; however they cause significant

damage to the environment. These chemical based fertilizers also make use of nitrogenous fertilizers or chemicals, are expensive and not as conveniently available. The value of biofertilizers has further increased in an increasingly eco-conscious world. Since these fertilizers are eco-friendly they can be used generously to promote healthy crops. The quality of the soil is also improved thanks to these environmentally friendly fertilizers<sup>3,4</sup>.

Formulation is a crucial aspect for producing inoculants containing an effective bacterial strain and can determine the success or failure of a biological agent<sup>5</sup>. Formulation typically consists of establishing the active ingredient (i.e., microorganism) in a suitable carrier together with additives that aid in the stabilization and protection of the microbial cells during storage and transport, and at the target site. Whether a product is new or improved, it is imperative that the formulation be stable during production, distribution, storage, and

\* To whom all correspondence should be addressed.  
E-mail: [biologiask@gmail.com](mailto:biologiask@gmail.com)

transportation<sup>6</sup>. The formulation should also be easy to handle and apply so that it is delivered to the target in the most appropriate manner and form, protects the agent from harmful environmental factors, and maintain or enhance activity of the organism in the field<sup>7,8</sup>. Another important consideration is the cost-effectiveness of the formulation. Therefore, several critical factors including user preference have to be considered before delivery of the final product. Commercial inoculant formulations are available as powder, granule, and liquid. Generally, peat has been the preferred carrier in powder form. The rhizobial cells in the inoculant are metabolically active and continue to grow and multiply as long as favorable nutrient and environmental conditions are maintained [9]. In the present study, formulation of bacterial biofertilizers has been studied.

## MATERIALS AND METHODS

### Bacterial biofertilizers

The bacterial biofertilizers i.e., *Rhizobium*, *Acetobacter* and *Azospirillum* were obtained from Krishna Agro Biotech, Chennai and the cultures were maintained on Nutrient Agar slants.

### Evaluation of improved persistence of bacterial biofertilizers with semi synthetic formulation

#### Inoculum preparation

The respective biofertilizers was inoculated into SYG Medium (2% Peptone, 1% Glucose, 0.2% Yeast extract, 0.1%  $K_2HPO_4$ , 0.1%  $KH_2PO_4$ , 0.05%  $MgSO_4 \cdot 7H_2O$ , 0.02%  $MnCl_2$ , 0.02%  $ZnSO_4 \cdot 7H_2O$ , 0.02%  $FeSO_4 \cdot 7H_2O$ ) and incubated at 37°C for 48 hours under shaking conditions. After incubation the cells were harvested by centrifugation, 1000 rpm for 15 minutes and the collected cell pellets were washed in phosphate buffer saline and the washed cell suspension was used as source of inoculum.

#### Formulation with biogel

The media with the following composition was prepared (100gm rice powder, 100gm soyabean powder, 2gm glucose, 1gm  $CaCO_3$ , 1gm yeast extract, 20gm soil, 50mg  $FeSO_4$ , 10gm  $MnCl_2$ , 10gm cotton seed powder) and was kept for sterilization in a water bath for 1 hour. Then the washed centrifuged cells was mixed and spread on glass plate and kept at room temperature for drying for 4 days. After incubation period the mixture was grinded into fine powder and sprinkled over the

soil, kept in pots.

### Formulation with Chitosan

Chitosan (Analytical grade-ä) was dissolved at different concentrations (0.1, 0.25, 0.50, and 0.75) with glacial acetic acid under sterile conditions for half an hour. After stirring, the reaction mixture was kept overnight in hot air oven to obtain fine powder. The dried powder (1g) was mixed with the respective bacterial inocula, kept at room temperature for 24 hours. Later the cells coated chitosan was sprinkled over the soil kept in pots.

### Persistence Study

After 10 days of the treatment, the treated soil was evaluated for the occurrence of Bacterial Biofertilizers. After the successive biogel and chitosan treatment the treated soil sample (10g) was suspended in 90 ml of sterile distilled water, kept under shaking conditions for 10 mins. The suspended sample was serially diluted, 0.1ml of the aliquote was spread plated on Yeast Extract Mannitol Agar (YEMA), nitrogen free minimal media for *Rhizobium*, *Acetobacter* and *Azospirillum*. The inoculated plates was incubated at 37°C for 48 hours. After the incubation the colonies were counted and recorded.

### Seed Treatment

The healthy and mature seeds of green gram and black gram were purchased from Agriculture Department and used for further studies. Both the seeds were soaked overnight in both the formulation containing respective bacterial biofertilizers. After overnight incubation the seeds were sown in respective pots. Seedling emergence was recorded and plant growth parameters such as shoot length, number of new branches emerged, leaf surface area, chlorophyll content, Nitrate reductase assay in respective treatment.

## RESULT AND DISCUSSION

A key constraint to successfully commercializing beneficial microorganisms is overcoming difficulties in formulating a viable, cost-effective, and user-friendly final product<sup>10,11</sup>. The live nature of the active ingredient (i.e., the microbial agent) underscores the importance of formulation in maintaining the microbial cells in a metabolically and physiologically competent state in order to obtain the desired benefit when applied<sup>13</sup>.

The development of new microbial formulations is a challenging task and requires greater effort in terms of funding and research towards making significant advances in this field. Worldwide, Cote<sup>14</sup> reported that, Persistence of insecticidal activity of novel bioencapsulated formulations of *Bacillus thuringiensis* var. *kurstaki* against

*Choristoneura rosaceana*. DiPel™, a registered *Bacillus thuringiensis* var. *kurstaki* (Btk)-based formulation, and experimental bio-encapsulated Btk formulations were sprayed in an apple orchard. Their persistence was assessed in the laboratory against obliquebanded leaier {*Choristoneura rosaceana*) larvae for three consecutive years.

As in control 100% seedling emergence was recorded in both tested seeds. But the time taken to emerge varied in respective treatments (Figure 1,2). In case of Black gram (*Vigna mungo L.*) 30%, 60%, 100%; 20%, 64%, 100%; 25%, 70%, 100% of seedling emergence was recorded in *Rhizobium*, *Azotobacter* and *Azospirillum* formulated with biogel matrix. In case of Green gram (*Vigna radiata*) 20%, 44%, 100%; 22%, 45%, 100%; 26%, 56%, 100% of seedling emergence was recorded. As in control 100% seedling emergence was recorded in both tested seeds. But the time taken to emerge varied in respective treatments. In case of Black gram (*Vigna mungo L.*) 15%, 25%, 100%; 17%, 24%, 100%; 19%, 25%, 100% of seedling emergence was recorded in *Rhizobium*, *Azotobacter* and *Azospirillum* formulated with biogel matrix. In case of Green gram (*Vigna radiata*) 17%, 22%, 100%; 19%, 23%, 100%; 18%, 22%, 100% of seedling emergence was recorded.

Total count of respective bacterial biofertilizer was increased in respective test periods. 35x10<sup>2</sup>, 13x10<sup>6</sup>, 14x10<sup>7</sup>, 40x10<sup>2</sup>, 05x10<sup>4</sup>, 21x10<sup>6</sup>, 89x10<sup>2</sup>, 116x10<sup>4</sup> and 135x10<sup>6</sup> CFU/g of *Rhizobium*, *Azotobacter* and *Azospirillum* was recorded in biogel matrix formulation at 10, 20 and 30 days of treatment. But the untreated control reveals 17x10<sup>2</sup>, 21x10<sup>4</sup>, 10x10<sup>5</sup>, 11.3x10<sup>3</sup>, 19x10<sup>4</sup>, 41x10<sup>4</sup>, 10x10<sup>3</sup>, 19x10<sup>4</sup>, 07x10<sup>5</sup> CFU/g of *Rhizobium*, *Azotobacter* and *Azospirillum* (Table 1)

#### Effect of formulation on plant growth parameters of black gram (*vigna mungo L.*)

The formulated black gram (*Vigna mungo L.*) plants recorded higher value in all the parameters measured than untreated control. There were significant differences in shoot length, and leaf surface area count per plant. The length of shoot was found to be increased in all the tested time period in the formulated soil with Biogel matrix in *Rhizobium* viz; 12.2cm, 142.9cm, 14.5cm on 5<sup>th</sup>, 10<sup>th</sup> and 15<sup>th</sup> days but in control, the length of shoot at respective time period was 9.5cm, 10.6cm and 12.5cm. The leaf surface area in Biogel matrix of *Rhizobium* was found to be increased from 1.5cm, 2.7cm and 5.1cm whereas in control it was found as 1.2cm, 2.6cm and 5.5cm. Similarly the soil treated with Chitosan reveals significant differences in the length of shoot; 11.3cm, 11.1cm

	<i>Azospirillum</i> (Biogel matrix)	+	+	+	+
	<i>Azospirillum</i> (Chitosan formulation)	+	+	+	+

the leaf surface area of control was observed as 1.4cm, 2.6cm and 5.3cm; 1.9cm 2.3cm and 4.2cm in Biogel matrix and in Chitosan 1.7cm 2.2cm and 4.0cm was measured.

After 30<sup>th</sup> days of respective formulated biofertilizer treatment the total N, total P and total K level was increased than untreated control (Table 4). Biogel matrix formulated *Rhizobium* reveals 650mg/kg of total N and 613mg/kg of total N Chitosan formulation. But control reveals 570mg/kg of total N, but no distinct difference in K and P. Total P and total K was recorded in respective biogel matrix and chitosan formulation as 467mg/kg, 457mg/kg and 727mg/kg, 711mg/kg (Table 2,3,4). As in formulated *Azotobacter* and *Azospirillum* treatment 672mg/kg, 625mg/kg and 670mg/kg, 630mg/kg of total N was recorded in biogel matrix and chitosan formulation. 470mg/kg, 460mg/kg of total P and 729mg/kg, 722mg/kg of total K and 468mg/kg, 465mg/kg of total P and 730mg/kg, 725mg/kg of total K was recorded in respective biogel matrix and chitosan formulation

All the microbial population was significantly increased in respective biogel

matrix formulation and chitosan treatment (Table 5,6,7).  $17 \times 10^4$ ,  $16 \times 10^6$ ,  $11 \times 10^7$ ,  $11 \times 10^7$ ,  $18 \times 10^4$ ,  $27 \times 10^6$ ,  $32 \times 10^7$ ,  $42 \times 10^7$ ,  $20 \times 10^4$ ,  $31 \times 10^6$ ,  $35 \times 10^7$ ,  $50 \times 10^7$  CFU/g and  $21 \times 10^4$ ,  $47 \times 10^6$ ,  $37 \times 10^7$ ,  $41 \times 10^7$ ,  $20 \times 10^4$ ,  $50 \times 10^6$ ,  $47 \times 10^7$ ,  $50 \times 10^7$ ,  $22 \times 10^4$ ,  $29 \times 10^6$ ,  $57 \times 10^7$ ,  $57 \times 10^7$  CFU/g of bacterial population was recorded in biogel matrix and chitosan formulation (Table 5). Similarly the Fungal population in respective treatment was  $21 \times 10^4$ ,  $25 \times 10^6$ ,  $15 \times 10^7$ ,  $19 \times 10^7$ ,  $30 \times 10^4$ ,  $35 \times 10^6$ ,  $39 \times 10^7$ ,  $56 \times 10^7$ ,  $32 \times 10^4$ ,  $37 \times 10^6$ ,  $49 \times 10^7$ ,  $60 \times 10^7$  CFU/g and  $27 \times 10^4$ ,  $52 \times 10^6$ ,  $49 \times 10^7$ ,  $51 \times 10^7$ ,  $28 \times 10^4$ ,  $48 \times 10^6$ ,  $39 \times 10^7$ ,  $65 \times 10^7$ ,  $17 \times 10^4$ ,  $32 \times 10^6$ ,  $54 \times 10^7$ ,  $43 \times 10^7$  CFU/g. Actinomycetes population respective treatment was  $15 \times 10^4$ ,  $20 \times 10^6$ ,  $17 \times 10^7$ ,  $14 \times 10^7$ ,  $32 \times 10^4$ ,  $37 \times 10^6$ ,  $40 \times 10^7$ ,  $65 \times 10^7$ ,  $49 \times 10^4$ ,  $57 \times 10^6$ ,  $65 \times 10^7$ ,  $68 \times 10^7$  CFU/g and  $35 \times 10^4$ ,  $27 \times 10^6$ ,  $50 \times 10^7$ ,  $48 \times 10^7$ ,  $32 \times 10^4$ ,  $62 \times 10^6$ ,  $25 \times 10^7$ ,  $72 \times 10^7$ ,  $24 \times 10^4$ ,  $47 \times 10^6$ ,  $75 \times 10^7$ ,  $67 \times 10^7$  CFU/g

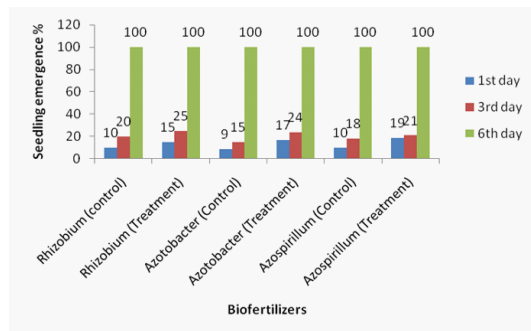

The effect of temperature reveals that the formulated biofertilizers retained viability at all the tested temperatures.  $17 \times 10^5$ ,  $27 \times 10^6$ ,  $20 \times 10^7$  and  $10 \times 10^5$ ,  $19 \times 10^6$ ,  $17 \times 10^7$  CFU/g was counted in biogel matrix and chitosan treated *Rhizobium*

**Fig. 1.** Seedling emergence % of Black gram (*Vigna mungo* L.) with Biogel Matrix formulated Biofertilizers

**Fig. 2.** Seedling emergence % of Green gram (*Vigna radiata*) with Biogel matrix formulated Biofertilizers

**Fig. 3.** Seedling emergence % of Black gram (*Vigna mungo* L.) with Chitosan formulated Biofertilizers

**Fig. 4.** Seedling emergence % of Green gram (*Vigna radiata*) with Chitosan formulated Biofertilizers

In *Azotobacter*  $17 \times 10^5$ ,  $21 \times 10^6$ ,  $42 \times 10^7$  and  $11 \times 10^5$ ,  $18 \times 10^6$ ,  $39 \times 10^7$  CFU/g was counted in biogel matrix and chitosan. But in control  $11.3 \times 10^3$ ,  $19 \times 10^4$ ,  $41 \times 10^4$  CFU/g was observed. In *Azospirillum*  $12 \times 10^5$ ,  $21 \times 10^6$ ,  $09 \times 10^7$  and  $11 \times 10^5$ ,  $15 \times 10^6$ ,  $08 \times 10^7$  CFU/g was counted in biogel matrix and chitosan. But in control  $10 \times 10^3$ ,  $19 \times 10^4$ ,  $07 \times 10^5$  CFU/g was observed (**Table 8,9,10**). Alkaline Phosphatase and Urease enzyme activity was recorded in all the tested time period in all the formulated Biofertilizers as in control (Table 11,12,13). The Chlorophyll content was significantly increased in all the biofertilizer formulated plants than control. In control 121.0 mg/g and 128.0 mg/g was observed in Black gram (*Vigna mungo* L.) and Green gram (*Vigna radiata*). Similarly in biogel matrix and chitosan formulated with *Rhizobium*, *Azotobacter* and *Azospirillum* 176.0 mg/g, 147.0 mg/g; 135.0 mg/g, 129.0 mg/g; 141.0 mg/g, 152.0 mg/g; 128.0 mg/g, 148.0 mg/g; 169.0 mg/g, 130 mg/g; and 145.0 mg/g, 137.0 mg/g was observed in Black gram (*Vigna mungo* L.) and Green gram (*Vigna radiata*) (Table 14). Nitrate reductase activity was recorded in all the tested time period in all the formulated Biofertilizers as in control (Table 15). The present study would suggest the possible utilization of encapsulated biofertilizers for the sustainable organic agriculture.
